

MCQ Test Results

Q1: In reinforcement learning, what is the primary goal?

Your answer: C. To minimize the expected loss at each training point.

Correct answer: B

Explanation: The text explicitly states that the goal in reinforcement learning is to find the input x^* that gives the maximum reward $R(x^*)$.

Q2: What is the core feature of reinforcement learning that combines search with?

Your answer: A. Supervised learning

Correct answer: B

Explanation: The passage emphasizes that reinforcement learning combines search and long-term memory, where search results are stored to reduce future search effort.

Q3: According to the text, what terms do psychologists use to describe experimental situations similar to reinforcement learning?

Your answer: A. Supervised and unsupervised learning

Correct answer: B

Explanation: The text states that psychologists use the terms "instrumental conditioning" or "operant conditioning" to refer to situations where an animal's actions influence subsequent events, similar to reinforcement learning.

Q4: What is the "Law of Effect" as articulated by Thorndike?

Your answer: A. Actions followed by negative consequences are less likely to be repeated.

Correct answer: B

Explanation: The passage explains that the Law of Effect posits that actions followed by a satisfactory state of affairs are reinforced, meaning the tendency to produce that action is strengthened.

Q5: What type of decision tasks are most relevant to approximate dynamic programming in the context of reinforcement learning?

Your answer: A. Single-step decision tasks

Correct answer: B

Explanation: The text clearly states that the reinforcement learning tasks most relevant to approximate DP are sequential decision tasks, where a sequence of decisions impacts the environment and leads to rewards.
